WIERER

Crossing the roof with the highest level of safety afforded by Camini Wierer.

The risk of house fires due to poorly installed flues is, unfortunately, an ever more current problem. This situation is especially risky for wood-burning stoves where smoke temperatures are rather high and the smoke exhaust system must cross wooden structures like the roof. Camini Wierer's ProTetto is the safest and most practical solution to crossing wooden roofs. The product is approved by DBT, Berlin. In order to simplify and safely install a smoke exhaust system that crosses wooden structures, Camini Wierer has designed and developed a special roof crossing system, efficient, safe and simple to install, made of a new fibreglass insulation material with insulation capacity highly superior to traditional insulation materials such as rock wool. The special composition is able to reduce the distance between the smoke exhaust flue and combustible fuels to just 100 mm compared to the standard 500 mm, permitting direct contact between the crossing element and the wooden structure.

The following is required for installation:

- A hole in the wooden structure
- The roof crossing element inserted and secured
- The roof crossing element covered with a front panel made of vermiculite to create a protection screen against the radiated heat.
- Finish with special finished stainless steel washer.

The roof crossing designed by Camini Wierer comes in sizes from 130 mm diameter to 250 mm diameter and to cross structures 12, 24, 36 and 100 cm thick. It was tested and approved by D.I.B.T., Deutsche Institut für Bautechnik, Berlin (certificate number: Z-7.4-3408) and therefore able to offer certified safety.

Technical data

Nominal Ø mm:	130	150	180	200	250
Outside Ø mm:	180	200	230	250	300
Wall bushing Ø mm:	360	380	410	430	480

roof thickness in mm

VERMICULIT® plate
615x615mm*

* 120/240/360 mm thickness for the product is sold with a plate of Vermiculit®. For 1000 the thickness of the product is sold with two plates of Vermiculit®.
